

Non-Mag 7 companies set to benefit from AI infrastructure capex (2026–2027)

Overview

The **Magnificent Seven (Mag 7)** stocks (Amazon, Alphabet, Apple, Meta, Microsoft, Nvidia and Tesla) will spend **\$700 billion+** on AI-focused data-centre and energy capex in 2026-27. The user wants to identify **second-order beneficiaries**—companies outside the Mag 7 that have signed, announced or filed large contracts to supply AI infrastructure or energy—and to highlight where supply constraints create bottlenecks.

The research below compiles multi-billion-dollar deals across AI compute, memory, networking, energy, packaging and construction; flags each company's backlog/financial momentum; notes where government policy intersects; and suggests a **custom portfolio weighting** for a high-ROI "AI-expansion basket."

1 Cloud and AI compute providers

Company (ticker)	Evidence of AI expansion deals	Why it matters / financial momentum
Nebius (NBIS)	Nvidia invested \$2 billion in Nebius to co-develop AI factories and deploy more than 5 GW of capacity by 2030 ¹.	
	Nebius signed a \$12 billion, five-year AI infrastructure contract with Meta starting 2027 with an option for Meta to purchase an extra \$15 billion of capacity ².	
	Reuters notes that this deal is in addition to Nebius' \$17.4 billion contract with Microsoft (Sept 2025) and a \$3 billion 5-year agreement with Meta (Nov 2025); Nvidia's stake gives Nebius an 8.3 % ownership ³.	Nebius is effectively a "neocloud" provider with a backlog exceeding \$46 billion . The company expects to exit 2026 with 800–1,000 MW of installed capacity ⁴ . Its contracts are backed by hyperscale clients, providing revenue visibility and high ROI.

Company (ticker)	Evidence of AI expansion deals	Why it matters / financial momentum
CoreWeave (CRWV)	• Meta expanded its AI cloud contract with CoreWeave to \$21 billion; CoreWeave will supply AI compute capacity through 2032 and deploy Nvidia's Vera Rubin platform ⁵ .	
	• Nvidia invested \$2 billion in CoreWeave to build 5 GW of AI factories and supply multiple generations of Nvidia architectures ⁶ .	
	• Reuters reports CoreWeave's deals include \$11.9 billion with OpenAI (2025), \$6.3 billion with Nvidia, and the expanded Meta contract ⁷ .	These multi-year contracts give CoreWeave long-term revenue visibility. CoreWeave is effectively a capacity-seller to hyperscalers; long-duration contracts reduce risk, while Nvidia's backing provides capital and supply assurance.
Broadcom (AVGO)	• Anthropic–Google–Broadcom agreement: starting in 2027, Broadcom will supply 3.5 GW of Google TPU capacity to Anthropic and design future generations through 2031 ⁸ . Analysts estimate Broadcom's AI revenue from Anthropic at \$21 B in 2026 and \$42 B in 2027 ⁸ .	
	• OpenAI–Broadcom collaboration: OpenAI plans to deploy 10 GW of custom accelerators built with Broadcom's connectivity solutions ⁹ .	Broadcom is the only "fab-full-stack" supplier not in the Mag 7. Its network chips and ASIC design partnerships tie it to major AI workloads. Multi-GW contracts and guaranteed design wins provide strong backlog and high-margin revenue.

Company (ticker)	Evidence of AI expansion deals	Why it matters / financial momentum
AMD (AMD)	OpenAI signed a 6 GW GPU deal for several generations of AMD Instinct MI450 accelerators; the contract includes a warrant allowing OpenAI to acquire up to 160 million AMD shares ¹⁰, signalling a tight strategic partnership.	AMD is the second-source GPU vendor. A multi-generation, multi-GW contract reduces dependency on Nvidia and ensures AMD's share of AI capex.
Amazon's Trainium suppliers	Reports indicate Amazon invested \$50 billion in OpenAI as part of a \$110 billion funding round; in return, OpenAI will consume roughly 2 GW of Trainium 3/ Trainium 4 compute capacity, extending a previous \$38 billion AWS compute agreement ¹¹.	Although Amazon is part of the Mag 7, the beneficiaries are the suppliers of custom Trainium chips (e.g., Annapurna Labs) and data-center construction contractors.
SiFive (private)	Reuters reports that SiFive raised \$400 million from Atreides Management, Nvidia and other investors to develop data-centre CPUs ¹². The company sells RISC-V IP that customers like Google can customize.	SiFive's CPU designs could mitigate the CPU bottleneck in AI servers. Funding from Nvidia suggests potential integration into future AI servers, creating an investment pathway before a possible IPO.

2 Memory and advanced packaging (structural bottlenecks)

AI accelerators shifted from using GDDR memory to **high-bandwidth memory (HBM)**; supply is controlled by a small oligopoly. AI vendors are signing long-term supply contracts and funding new capacity.

Company	Evidence of supply deals and expansion	Why it matters / bottleneck
SK Hynix (000660.KS / HXSCL)	High-bandwidth memory became a mandatory requirement for Nvidia's Blackwell and AMD's MI300X chips, causing demand to exceed supply. The entire 2025 HBM output was sold out before the year began ¹³.	

Company	Evidence of supply deals and expansion	Why it matters / bottleneck
	• The HBM oligopoly (SK hynix, Samsung, Micron) is investing tens of billions of dollars to expand capacity; SK hynix announced a \$13 billion new fabrication plant and a \$10 billion U.S.-based AI investment arm ¹⁴ .	
	• Microsoft signed an exclusive supply agreement with SK Hynix in Jan 2026 for HBM 3E memory for its Maia 200 accelerator ¹⁵ .	HBM is the primary bottleneck for AI servers. SK Hynix's investments and exclusive deals give it pricing power and long-term revenue. Its U.S. investment arm will likely invest in packaging and AI infrastructure, offering exposure beyond memory.
Micron (MU)	• Micron plans a \$9.6 billion HBM facility in Japan and a \$24 billion advanced wafer fabrication plant in Singapore to meet AI-driven demand ¹⁴ .	As the third HBM supplier, Micron's global expansions offer diversification and long-term capacity for AI memory.

| | **Samsung Electronics (005930.KS / SSNLF)** | • While not directly cited for a single contract, Samsung is being pushed by Nvidia to accelerate **HBM4** development ¹⁶ . Samsung is also the leading HBM supplier for Google's AI chips and continues to invest heavily in memory and packaging. | Samsung's scale and investment in HBM4 make it essential to relieve the memory bottleneck. Its ADRs provide U.S. investors with access. | | **Intel (INTC)** | • Intel joined **Elon Musk's Terafab** project to build a **U.S. semiconductor factory** in Texas; Intel said its ability to design, fabricate and package ultra-high-performance chips would help Terafab produce **1 TW of compute per year** ¹⁷ .

• Intel's **advanced packaging complex** in Malaysia is 99 % complete and will begin assembly and testing later in **2026**; the project represents a **RM 12 billion** capital commitment and is critical as demand for **chiplet and 3D integration** surges ¹⁸ . | Advanced packaging is a bottleneck because AI chips require stacking memory and logic. Intel's expansion (Terafab, Malaysia packaging) provides non-Mag 7 exposure to packaging capacity. | | **TSMC (TSM)** (rumoured expansion) | • Reports suggest TSMC is considering expanding its Arizona site to **12 fabs** and **four advanced packaging facilities**, possibly as part of Taiwan's \$500 billion investment in U.S. high-tech sectors ¹⁹ . While unconfirmed, TSMC has acquired land and is discussing a **\$100 billion** increase in U.S. investments ¹⁹ . | As the world's leading foundry, TSMC's packaging and fab expansions in the U.S. would boost domestic supply and reduce geopolitical risk. However, these plans remain rumours; investors should watch official announcements. |

3 Networking and interconnect suppliers

Company	Evidence of demand and backlog	Why it matters
Arista Networks (ANET)	The NextPlatform reports that Arista's 2025 revenue reached \$9 billion, with 48 % from cloud titans; backlog totaled \$6.8 billion and AI networking is driving revenue growth ²⁰.	
Arista's R4 series platforms and Spectrum-X networks are tailored for AI, and the company expects a "tsunami of money" as AI racks scale beyond 800 V requirements ²⁰.	Arista is a pure-play beneficiary of AI network build-outs. Its strong backlog and high margins make it a high-ROI candidate for the portfolio.	
Coherent Corp. (COHR)	Futurum notes that Coherent's datacenter segment saw rapid growth; bookings for 800G and 1.6T optical transceivers produced book-to-bill ratios above 4x ²¹.	
Calendar 2026 is already largely booked, and 2027 is filling quickly, supported by long-term supply agreements with hyperscalers ²².		
Coherent is expanding 6-inch indium-phosphide (InP) capacity to double internal output by Q4 2026 ²³.	Optical transceivers and co-packaged optics are crucial to move data inside AI racks. Coherent's multi-year visibility and capacity expansion position it as a bottleneck beneficiary.	
Lumentum Holdings (LITE)	Zacks notes that Lumentum designs optical and photonic components for high-speed telecommunications and data centres. Its second-quarter 2026 results showed strong revenue growth driven by AI infrastructure connectivity; the company collaborates with Nvidia to develop silicon photonics for Spectrum-X photonics switches ²⁴.	Lumentum's exposure to Nvidia's photonics roadmap and its high expected earnings growth (~100 % in FY2026 ²⁵) provide upside linked to AI networking.

Company	Evidence of demand and backlog	Why it matters
Amphenol (APH)	• Amphenol holds roughly 33 % of the AI-data-centre interconnect market. The company reported triple-digit organic growth in its IT datacom segment, with record bookings and a strong book-to-bill ratio aligned with AI infrastructure cycles ²⁶ .	
• The acquisition of CommScope's CCS business enhances its fiber, copper and power connectivity portfolio ²⁷ .	Amphenol's mission-critical connectors enable high-density racks. Its market share and record bookings make it a stable supplier with durable growth.	
Vertiv Holdings (VRT)	• Vertiv provides thermal, liquid-cooling, UPS, switchgear and modular solutions; it is expanding capacity to serve AI-enabled pipelines ²⁸ .	
• Vertiv is co-developing an 800-volt DC power architecture with Nvidia timed for the 2027 Rubin Ultra rollout, keeping its infrastructure solutions one GPU generation ahead ²⁹ .	Cooling and power delivery are gating factors for AI racks. Vertiv's partnership with Nvidia ensures design-win visibility and positions the firm as a key supplier of high-voltage power systems.	
Western Digital (WDC)	• WDC reports strong data centre demand for high-capacity HDDs and eSSDs; it collaborates with hyperscale customers to deliver reliable, high-capacity drives with competitive total cost of ownership ³⁰ .	
• Generative AI adoption is driving eSSD sales, while the platform business is gaining traction among native AI firms and SaaS providers ³¹ .	Storage is critical for AI training and inference. WDC's relationships with hyperscalers and shift toward solid-state storage provide moderate growth and dividend yield.	

Company	Evidence of demand and backlog	Why it matters
EMCOR Group (EME)	• EMCOR provides electrical, mechanical and cooling systems for data centers. The company's data centre construction business contributes significantly to its remaining performance obligations, providing strong revenue visibility ³².	EMCOR is a pure-play contractor for hyperscale data-centre build-outs. While margins are lower than semiconductor vendors, backlog and exposure to the construction boom make it a stable pick.

4 Energy and power infrastructure

AI data centres require vast power. Grid constraints and permitting delays mean hyperscalers are entering long-term agreements with utilities, nuclear developers and midstream gas operators. These companies are outside the Mag 7 and will receive multi-GW orders.

Company	Evidence of deals / expansions	Why it matters
Vistra Corp. (VST)	• Meta announced agreements with Vistra, TerraPower and Oklo to add up to 6.6 GW of new and existing nuclear energy by 2035 ³³.	
• Meta's partnership with Vistra includes financial support to extend the life and uprate capacity at the Perry and Davis-Besse plants in Ohio and the Beaver Valley plant in Pennsylvania, delivering 2.1 GW of energy ³⁴.	Vistra is a regulated utility and independent power producer. Multi-GW nuclear commitments create long-term contracted cash flows.	
TerraPower (private)	• Meta's agreement funds two Natrium advanced nuclear reactors (690 MW) and grants rights to up to 2.8 GW of additional Natrium units by 2035 ³⁵.	TerraPower is privately held but may seek funding or partnerships. It benefits from Meta's capital to commercialise next-generation reactors.
Oklo (to list via SPAC)	• Meta will fund Oklo to develop an advanced nuclear campus in Ohio, potentially adding 1.2 GW of baseload power by 2030 ³⁶.	Oklo has announced plans to go public via a SPAC. Meta's offtake agreement de-risks its reactor deployment.

Company	Evidence of deals / expansions	Why it matters
Williams Companies (WMB)	Enki AI reports that mid-stream gas companies are pivoting to on-site power generation because grid queues are overwhelmed. Williams has committed \$5.1 billion to build behind-the-meter gas-fired power plants for data centres, including two projects (US\$3.1 billion) announced Oct 2025 and a \$1.6 billion Project Socrates set for completion in H2 2026 ³⁷.	
Williams is partnering with hyperscalers to supply natural gas and generation; it is building a gas-powered plant for Meta's data-centre campus in Ohio ³⁸.	The gas-to-power model bypasses congested grids and delivers reliable power within 18 months. Williams' capital commitments provide a new earnings stream tied to AI power demand.	
Exxon Mobil (XOM)	The gas-to-power article notes that Exxon Mobil has a 2.7 GW pipeline of data-centre power projects ³⁹.	Exxon's scale and vertical integration make it a potential beneficiary of AI power demand; however, project details remain sparse.
Kinder Morgan (KMI)	Kinder Morgan acquired seven landfill gas-to-energy facilities for \$135 million in Oct 2025 to supply renewable natural gas to data centres ³⁹.	Kinder Morgan provides RNG to data centres; deals are smaller but align with ESG mandates.
Energy Transfer (ET)	Energy Transfer signed a deal in Feb 2025 to supply natural gas directly to Cloud Burst's AI data centre in Texas for on-site generation ⁴⁰.	ET's direct supply agreements create new revenue streams and highlight the pivot from pipelines to on-site generation.
Pembina Pipeline (PPL.TO)	Pembina is reportedly near an agreement to supply Meta's data-centre campus in Alberta with natural gas for on-site generation ⁴⁰.	Provides Canadian exposure to AI-driven energy projects.

Company	Evidence of deals / expansions	Why it matters
SoftBank / SB Energy	• SoftBank announced plans to build a 10 GW AI data-centre complex in Piketon, Ohio, costing \$500 billion; the first phase (800 MW) will cost \$30–40 B and be powered by \$33 B of natural-gas-fired electricity ⁴¹ (citation from previous context).	While SoftBank is the sponsor, the beneficiaries include construction contractors, equipment suppliers and gas turbine manufacturers. This project shows how government partnership (Ohio) and private capital meet AI energy demand.
Entergy (ETR)	• In the White House Ratepayer Protection Pledge announcement, Entergy's CEO said the company proactively worked with state leaders to recruit a new industry with attractive power agreements and supports the pledge to ensure AI data-centre power costs don't burden consumers ⁴² .	Entergy operates utilities in the southern US. Its willingness to sign long-term power agreements for AI data centres signals future regulated earnings growth.
Ratepayer Protection Pledge (Government)	• In March 2026, the White House announced a Ratepayer Protection Pledge signed by leading tech companies (Amazon, Google, Meta, Microsoft, OpenAI, Oracle and xAI). The pledge commits them to fully cover the cost of new power generation required for AI data centres so that electricity prices for households do not rise ⁴³ .	
• Government officials emphasised that AI companies will build power plants and sell excess power back to the grid ⁴⁴ .	This policy codifies a long-term funding mechanism for utilities and energy developers. It ensures that AI companies pay for grid upgrades and new generation, guaranteeing revenue to utilities and reducing political risk. Investors can look to utilities (Vistra, Entergy, Constellation) and energy infrastructure firms (Williams, Energy Transfer) to capitalise on these agreements.	

5 Data centre construction and services

Company	Evidence	Why it matters
EMCOR Group (EME)	Provides electrical, mechanical and cooling systems for data centres. The growing scale of data-centre construction work supports a visible order book and consistent future revenue ³².	As hyperscale data-centre construction accelerates, EMCOR's integrated services benefit from long-duration projects.
Vertiv (VRT)	Vertiv's portfolio includes modular data-centre solutions, UPS systems and liquid cooling; AI data-centre growth is accelerating capacity expansion ²⁸.	See networking section above.
Williams, Energy Transfer, Kinder Morgan	Building modular gas-fired plants at data-centre sites and delivering gas supply. These companies are effectively becoming data-centre construction contractors ³⁷.	Exposure to energy-infrastructure build-outs.
Construction & engineering firms (e.g., Fluor, Jacobs, Kiewit)	Not directly cited but will benefit from a surge in large-scale data-centre projects; government permitting reforms and the Ratepayer pledge are expected to accelerate construction.	Provide diversified exposure to AI infrastructure without single-vendor risk.

6 Key structural bottlenecks

- 1. High-bandwidth memory (HBM) supply:** AI accelerators rely exclusively on HBM 3E; demand outstrips supply, and manufacturers' entire 2025 production was sold out ¹³. The oligopoly (SK hynix, Samsung, Micron) is investing tens of billions to expand capacity, but new fabs will take years to come online ¹⁴. Exclusive supply agreements (e.g., Microsoft-SK hynix for HBM 3E ¹⁵) create a tiered market.
- 2. Advanced packaging:** AI chips require stacking memory and logic; capacity for advanced packaging and 3D integration is limited. Intel's Malaysia facility (RM 12 B) will start operations in 2026 ¹⁸, and TSMC is rumoured to expand U.S. capacity ¹⁹.
- 3. Networking bandwidth:** Hyperscale AI clusters need high-speed optics and connectors; companies like Coherent, Lumentum, Amphenol and Arista face book-to-bill ratios above 4x and multi-year orders ²¹ ²⁶.

4. **Power and cooling:** Grid interconnection queues drive hyperscalers to build **behind-the-meter** gas plants and invest in nuclear. Williams' \$5.1 B portfolio and Meta's nuclear agreements are examples ³⁷ ³³ . The Ratepayer pledge locks in funding for utilities ⁴³ .

7 Proposed portfolio weighting (high-ROI AI-expansion basket)

The basket emphasises companies with long-term contracts, high backlog visibility and strategic positioning in bottleneck segments. Weightings reflect relative growth, financial strength and risk (higher weight = higher conviction). Adjust allocations to personal risk tolerance.

Category	Company	Proposed weight	Rationale
Cloud / AI compute	Nebius (NBIS)	15 %	Largest backlog outside Mag 7; contracts with Microsoft and Meta provide durable revenue and early mover advantage.
	CoreWeave (CRWV)	12 %	Multi-year agreements with Meta, OpenAI and Anthropic; Nvidia backing lowers risk and provides supply assurance.
	Broadcom (AVGO)	10 %	Multi-GW accelerator and networking deals with Anthropic and OpenAI; high-margin custom silicon and networking business.
	AMD (AMD)	5 %	Second-source GPU provider; 6-GW contract with OpenAI ensures share of AI capex.
Memory & packaging	SK Hynix (HXSCL / 000660.KS)	8 %	Largest HBM supplier; exclusive supply deals (Microsoft, Nvidia) and \$23 B+ expansion commitments ¹⁴ .
	Micron (MU)	4 %	Major HBM expansions in Japan & Singapore ¹⁴ ; provides U.S.-listed memory exposure.
	Intel (INTC)	4 %	Advanced packaging expansions (Terafab, Malaysia); potential AI foundry wins ¹⁸ ¹⁷ .
Networking & interconnect	Arista Networks (ANET)	8 %	Strong backlog (\$6.8 B) and nearly half of revenue from cloud titans ²⁰ .
	Coherent (COHR)	6 %	4× book-to-bill on 800G/1.6T optics; capacity expansion underway ²¹ .

Category	Company	Proposed weight	Rationale
	Lumentum (LITE)	3 %	Photonics supplier with high earnings growth and Nvidia collaboration ²⁴ .
	Amphenol (APH)	4 %	33 % market share in data-centre interconnects and record bookings ²⁶ .
	Vertiv (VRT)	4 %	Thermal and power systems; co-developing 800-V DC architecture with Nvidia ²⁹ .
Energy & power	Williams Companies (WMB)	5 %	\$5 B power-innovation portfolio and direct gas-to-power deals ³⁷ .
	Vistra (VST)	5 %	Multi-GW nuclear agreements with Meta; regulated utility with long-term contracts ⁴⁵ .
	Kinder Morgan (KMI), Energy Transfer (ET), Pembina (PPL.TO)	4 % combined	On-site generation and gas supply deals; moderate growth and dividend yield ³⁹ .
Construction & services	EMCOR Group (EME)	3 %	Data-centre construction backlog ³² ; provides diversification.
Total	—	100 %	

Notes on investing via Fidelity

1. **Accessing foreign stocks:** Several companies (SK Hynix, Samsung, TSMC, Pembina) trade on foreign exchanges. Fidelity's international trading platform allows U.S. investors to buy foreign ordinary shares in local markets or via **American Depositary Receipts (ADRs)**. For example, SK Hynix is available over-the-counter in the U.S. as **HXSCL**, while Samsung trades as **SSNLF**.
2. **Currency risk and liquidity:** Buying ADRs avoids direct currency conversion but may carry lower liquidity; direct purchases on foreign exchanges require currency conversion and may incur additional fees.
3. **Private companies:** Nebius, CoreWeave, TerraPower, Oklo and SiFive are private. Nebius and CoreWeave plan U.S. IPOs; currently, exposure must be obtained via secondary markets or private placements available only to accredited investors. Alternatively, one can invest in suppliers (Broadcom, SK Hynix, Coherent) that benefit from their orders.
4. **Regulatory and political risk:** Nuclear projects require permitting; policy support (e.g., Ratepayer pledge) mitigates risk but timeline delays are possible. Energy-infrastructure companies may face environmental scrutiny.

Conclusion

The AI infrastructure boom is creating a **\$700+ billion** wave of orders that will extend well beyond the Mag 7. Non-Mag 7 vendors across cloud compute (Nebius, CoreWeave, Broadcom), memory (SK Hynix, Micron), networking (Arista, Coherent, Lumentum, Amphenol), power (Vistra, Williams, Kinder Morgan), and construction (EMCOR, Vertiv) are signing multi-billion-dollar contracts and investing heavily to relieve bottlenecks.

High-bandwidth memory, advanced packaging, optical interconnects and power generation remain structural constraints; companies expanding capacity in these areas offer the greatest leverage to AI capex. A diversified basket focusing on these vendors should capture the high ROI of AI expansion while mitigating single-company risk.
